Northstar Small Business Lab

INVENTORY WORKFLOW PILOT — SYNTHETIC TEST FIXTURE

IMPORTANT: This is fictional test data created only to test AI workflow behavior. All organizations, figures, dates, and pilot results are invented. Do not treat this document as real-world evidence.

1. Background

A fictional group called Northstar Small Business Lab conducted a short inventory workflow assessment involving 20 fictional small retailers in 2025.

2. Baseline observations

The assessment recorded the following baseline measurements:

Measure	Reported value
Fictional retailers	20
Average orders per business per day	120
Manual processing time per order	18 minutes
Order correction rate	12% of recorded orders

The assessment did not measure revenue, profit, or customer retention.

3. Pilot observations

Two separate fictional pilots tested an AI-assisted reorder suggestion tool.

Pilot	Participants	Change in stockout incidents	Period
Pilot A	5 fictional stores	18% reduction	6 weeks
Pilot B	4 fictional stores	9% reduction	4 weeks

The pilots used different store groups and different observation periods. The results should not be combined into a single average without further evidence.

4. Limitations

• Small, non-random sample.
• No control group.
• Short observation periods.
• No audited financial outcomes.
• No evidence about revenue growth or profitability.
• No evidence about performance across all MSMEs.

5. Source details

Title: Northstar Small Business Lab — Inventory Workflow Pilot (Synthetic Test Fixture)
Publisher: Fictional Northstar Small Business Lab
Publication date: 15 December 2025
Document type: Synthetic test document; not a real study.

6. Test questions

1. What inventory-processing pain points are described?
2. What baseline measurements are reported?
3. What were the two pilot outcomes?
4. Why should the two pilot outcomes not automatically be combined?
5. Does this document prove a 50% revenue increase? (Correct answer: No.)
